

Positive Quality Intervention: Ibrutinib Management

Description:

Ibrutinib (Imbruvica ®) has indications in Mantle Cell Lymphoma, Chronic/Small Lymphocytic Leukemia, Marginal Zone Lymphoma, Waldenstrom Macroglobulinemia, and Graft Versus Host Disease (GVHD). This PQI will discuss strategies for medication dosing and adverse event management to improve patient outcomes.

Background:

Dosing of ibrutinib varies by disease/indication and should be carefully assessed. Although the dose may stabilize over time, drug interactions frequently occur with common anti-infective agents. Lymphocytosis is a noted adverse effect of ibrutinib which results in an increased count of lymphocytes in the blood; a common and expected occurrence which does not reflect progression of the disease. Monitoring patient laboratory values must be considered and evaluated based on patient need.

PQI Process:

Upon receiving new ibrutinib prescription:

- Confirm appropriate dosing and indication.
- Monitor CBC at baseline, monthly and as clinically necessary
- Monitor CMP, Uric Acid Levels at baseline, monthly and as clinically necessary
- Consider ECG at baseline (positive cardiac history/ risk factors) and periodically as necessary
- Evaluate patients on anticoagulation, including aspirin, for bleeding risk. The use of anticoagulation with ibrutinib should be assessed with each patient based on risk versus benefit. It is recommended to withhold treatment 3 days pre/post minor surgical procedures and pre/post 7 days for major surgical procedures
- Consider *Pneumocystis jirovecii* Pneumonia (PJP) prophylaxis in patients with increased risk of opportunistic infections
- Lymphocytosis: Upon initiation of Ibrutinib, lymphocytosis commonly occurs in first weeks and resolves by week 8 of therapy; does not reflect disease progression
- Monitor for drug interactions, adherence, and adverse effects

Important notice: National Community Oncology Dispensing Association, Inc. (NCODA), has developed this Positive Quality Intervention platform. This platform represents a brief summary of medication uses and therapy options derived from information provided by the drug manufacturer and other resources. This platform is intended as an educational aid and does not provide individual medical advice and does not substitute for the advice of a qualified healthcare professional. This platform does not cover all existing information related to the possible uses, directions, doses, precautions, warning, interactions, adverse effects, or risks associated with the medication discussed in the platform and is not intended as a substitute for the advice of a qualified healthcare professional. The materials contained in this platform are for informational purposes only and do not constitute or imply endorsement, recommendation, or favoring of this medication by NCODA, which assumes no liability for and does not ensure the accuracy of the information presented. NCODA does not make any representations with respect to the medications whatsoever, and any and all decisions, with respect to such medications, are at the sole risk of the individual consuming the medication. All decisions related to taking this medication should be made with the guidance and under the direction of a qualified healthcare professional.

Dosing Guidelines*

| Indication | Dose (Daily) | Efficacy |
|-------------------------------|--------------|--|
| CLL | 420 mg | <i>Byrd et al., 2014²</i> |
| Mantle Cell Lymphoma | 560 mg | <i>Wang et al., 2015⁴</i> |
| Marginal Zone Lymphoma | 560 mg | <i>Noy et al., 2017³</i> |
| Waldenstrom Macroglobulinemia | 420 mg | <i>Dimopoulos et al., 2018¹</i> |
| Chronic GVHD | 420 mg | <i>Miklos et al., 2016⁵</i> |

*Ibrutinib dosing may vary with combination therapies and with drug interactions.

Adverse Effects

| Adverse Reaction | All Grades (%) |
|-----------------------------|----------------|
| Diarrhea | 51 |
| Fatigue | 41 |
| Musculoskeletal Pain | 37 |
| Peripheral Edema | 35 |
| Respiratory Tract Infection | 34 |
| Nausea | 31 |
| Bruising | 30 |

| Adverse Reaction | Grades ≥3 (%) |
|------------------------|---------------|
| Hemorrhage | 6 |
| Infections | 29 |
| Cytopenias | 13-39 |
| Cardiac Arrhythmia | 6 |
| Secondary Malignancies | 16 |
| Hypertension | 17 |

Recommended Dose Modifications for Toxicity

| Toxicity Occurrence | MCL and MZL After Recovery Starting Dose = 560 mg | CLL/SLL, WM, and cGVHD After Recovery Starting Dose = 420 mg |
|---------------------|---|--|
| First | Restart at 560 mg daily | Restart at 420 mg daily |
| Second | Restart at 420 mg daily | Restart at 280 mg daily |
| Third | Restart at 280 mg daily | Restart at 140 mg daily |
| Fourth | Discontinue | Discontinue |

All decisions related to taking this medication should be made with the guidance and under the direction of a qualified healthcare professional.

Patient Centered Activities:

- Provide Oncology Chemotherapy Education (OCE) sheet
- Ensure patients understand the formulation prescribed and how to take their dose.
 - Varying Dosage Forms: capsules - 70 mg, 140 mg; tablets - 140 mg, 280 mg, 420 mg, 560 mg
- Administer orally once daily with a glass of water
- Swallow capsules whole; do not break, crush, chew
- If a dose of ibrutinib is not taken at the scheduled time, it can be taken as soon as possible on the same day with a return to the normal schedule the following day
- Proper sign/symptom monitoring
 - Abnormal bruising or bleeding especially those on anticoagulation or aspirin
 - GI tolerance issues (nausea, vomiting, diarrhea, etc.)
 - Any new medications (assess for risk of QT prolongation or other drug-drug interactions, particularly with acute anti-infective drugs, with potential for holding or lowering ibrutinib dose during certain required treatments)
- Evaluate if patients have missed any doses between cycles to determine if interventions are needed such as reminders, calendars, pill boxes, etc.

Drug Interactions:

- CYP3A4 Inducers (Strong): May decrease the serum concentration of Ibrutinib. (e.g. Carbamazepine, rifampin, phenytoin, St. John's Wort) Risk: Avoid combination
- CYP3A4 Inhibitors (Strong): May increase the serum concentration of Ibrutinib. Management: Avoid concomitant use of ibrutinib and strong CYP3A4 inhibitors. If a strong CYP3A4 inhibitor must be used short-term (eg, anti-infectives for 7 days or less), interrupt ibrutinib therapy until the strong CYP3A4 inhibitor is discontinued (e.g. Ketoconazole, Itraconazole, voriconazole, Posaconazole, Clarithromycin, Telithromycin). Risk: Avoid combination
- Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Immunosuppressants may diminish the therapeutic effect of Vaccines (Live). Management: Avoid use of live organism vaccines with immunosuppressants; live-attenuated vaccines should not be given for at least 3 months after immunosuppressants. Risk: Avoid combination
- Warfarin and anticoagulation: increased bleeding risk: Consider risk versus benefit.
 - Secondary analysis of RESONATE trial and Phase I study participants on anticoagulation and ibrutinib - Among 175 patients receiving concomitant anticoagulant or antiplatelet agents, 5 had major bleeding events (3%), and Grade 1 bleed in occurred in 10-20%. These events were typically observed in conjunction with other factors, such as coexisting medical conditions and/or concurrent medications.⁶
