

## Positive Quality Intervention: Gilteritinib (XOSPATA) for Relapsed/Refractory Acute Myeloid Leukemia (AML)

**Description:** This PQI will discuss proper patient selection and management of adverse events related to the administration of oral gilteritinib pharmacotherapy in patients with relapsed/refractory AML that have an FMS-like tyrosine kinase 3 (FLT3) mutation as detected by an FDA-approved test. Optimal patient identification, dosing, and follow-up are essential to help patients benefit fully while taking this medication.

**Background:** Gilteritinib is a tyrosine kinase inhibitor that has demonstrated activity in patients with relapsed/refractory (R/R) AML who have mutations in the internal tandem duplication (ITD) and/or tyrosine kinase domain (TKD) of FLT3 (found in 30% of AML population). This represents a treatment paradigm shift as the *first oral monotherapy option* for this particular subset of FLT3-mutated AML patients who, if interested in further treatment, would traditionally utilize IV salvage chemotherapy. Clinicians should be aware the need for molecular testing and identifying therapy options with the highest level of evidence. In the final analysis of the ADMIRAL study, Overall Survival (OS) was reported as 9.3 months for patients receiving gilteritinib versus 5.6 months for those receiving salvage chemotherapy (Hazard Ratio = 0.64 (95% CI 0.49, 0.83), P=0.0004). The rate of complete response (CR/CRh) was reported at 22.6%. The median time to first respond was 2 months and *transfusion-independence* was observed in 34.5% of patients, representing a potential improvement in quality of life.

### \*Common adverse events (all grade >30%):

- Transaminase increase (51%)
- Fatigue/malaise (44%)
- Fever (41%)
- Mucositis (41%)
- Edema (40%)
- Rash (36%)
- Diarrhea (35%)
- Dyspnea (35%)
- Nausea (30%)

### Rare and serious adverse events:

- Electrocardiogram QT prolonged (9%)
- Hypersensitivity (8%)
- Pancreatitis (5%)
- Cardiac Failure (4%)
- Pericardial Effusion (4%)
- Differentiation syndrome (3%)
- **[Boxed Warning]**
- Posterior reversible encephalopathy syndrome (1%)

*\*AE reported from 319 gilteritinib patients across 3 clinical trials*

**Important notice:** National Community Oncology Dispensing Association, Inc. (NCODA), has developed this Positive Quality Intervention platform. This platform represents a brief summary of medication uses and therapy options derived from information provided by the drug manufacturer and other resources. This platform is intended as an educational aid and does not provide individual medical advice and does not substitute for the advice of a qualified healthcare professional. This platform does not cover all existing information related to the possible uses, directions, doses, precautions, warning, interactions, adverse effects, or risks associated with the medication discussed in the platform and is not intended as a substitute for the advice of a qualified healthcare professional. The materials contained in this platform are for informational purposes only and do not constitute or imply endorsement, recommendation, or favoring of this medication by NCODA, which assumes no liability for and does not ensure the accuracy of the information presented. NCODA does not make any representations with respect to the medications whatsoever, and any and all decisions, with respect to such medications, are at the sole risk of the individual consuming the medication. All decisions related to taking this medication should be made with the guidance and under the direction of a qualified healthcare professional.

Recommended dose adjustments for toxicity:

Adverse Event	Recommended Action
<ul style="list-style-type: none"> <li>Differentiation Syndrome</li> </ul>	<ul style="list-style-type: none"> <li>systemic steroids until resolved for 3 days (interrupt gilteritinib if signs remain &gt;48H)</li> <li>Resume when symptoms improve to Grade 2</li> </ul>
<ul style="list-style-type: none"> <li>Posterior reversible encephalopathy syndrome (PRES)</li> </ul>	<ul style="list-style-type: none"> <li>Discontinue gilteritinib</li> </ul>
<ul style="list-style-type: none"> <li>QT<sub>c</sub> interval &gt; 500 msec</li> </ul>	<ul style="list-style-type: none"> <li>Interrupt gilteritinib and resume at reduced dose of 80 mg (2 x 40 mg tablets) daily when QT<sub>c</sub> interval returns to within 30 msec of baseline or ≤ 480 msec</li> </ul>
<ul style="list-style-type: none"> <li>QT<sub>c</sub> interval increased by &gt; 30 msec on ECG on day 8 of cycle 1</li> </ul>	<ul style="list-style-type: none"> <li>Confirm with ECG on day 9</li> <li>If confirmed, consider gilteritinib dose reduction to 80 mg (2 x 40 mg tablets) daily</li> </ul>
<ul style="list-style-type: none"> <li>Pancreatitis</li> </ul>	<ul style="list-style-type: none"> <li>Interrupt gilteritinib until pancreatitis is resolved and resume at a reduced dose of 80 mg (2 x 40 mg tablets) daily</li> </ul>
<ul style="list-style-type: none"> <li>Other grade 3 or higher toxicity (related to treatment)</li> </ul>	<ul style="list-style-type: none"> <li>Interrupt gilteritinib until toxicity resolves or improves to grade 1 and reduce dose to 80 mg (2 x 40 mg tablets) daily</li> </ul>

Gilteritinib is actively being studied in other AML settings including front-line therapy with induction chemotherapy, maintenance therapy after transplant, and in combination with hypomethylators.

**PQI Process (upon receipt of new prescription for gilteritinib):**

- Ensure that the correct dose is prescribed (3 x 40 mg oral tablets [120 mg total]) by mouth daily
- Ensure that baseline blood counts, chemistries, as well as creatine phosphokinase (CPK) have been assessed prior to initiation of gilteritinib. Schedule these labs for every week for the first month, every other week for the second month, and once monthly thereafter
- Patient should have ECG results prior to initiation of gilteritinib as well as appointments scheduled to receive follow-up ECGs on days 8 and 15 of the first cycle.

**Important notice:** National Community Oncology Dispensing Association, Inc. (NCODA), has developed this Positive Quality Intervention platform. This platform represents a brief summary of medication uses and therapy options derived from information provided by the drug manufacturer and other resources. This platform is intended as an educational aid and does not provide individual medical advice and does not substitute for the advice of a qualified healthcare professional. This platform does not cover all existing information related to the possible uses, directions, doses, precautions, warning, interactions, adverse effects, or risks associated with the medication discussed in the platform and is not intended as a substitute for the advice of a qualified healthcare professional. NCODA does not make any representations with respect to the medications whatsoever, and any and all decisions, with respect to such medications, are at the sole risk of the individual consuming the medication. All decisions related to taking this medication should be made with the guidance and under the direction of a qualified healthcare professional.

- Monitor for any signs/symptoms of pancreatitis, PRES, differentiation syndrome
  - Fever, dyspnea, hypoxia, pulmonary infiltrates, pleural effusions, edema
- Call office at first sign of fever (temperature >100.4F)
- Consider the use of antidiarrheals
- Important: Upon refill, check and clarify dosing, quantity, and instructions to the patient (number of tablets per dose, etc.)

#### **Patient Centered Activities:**

- Provide Oncology Chemotherapy Education (OCE) sheet
- Ensure patient knows the appropriate drug dose and schedule (3 x 40 mg oral tablets [120 mg total] once daily continuously)
- Ensure patient knows that the drug may be taken without regard to meals and that the tablets should not be broken or crushed
- Patients should take their dose as soon as possible if missed on the same day if at least 12 hours before next scheduled dose followed by a return to normal dosing schedule. Patient should not take two doses within 12 hours.
- Counsel female patients of childbearing age to use effective contraception during treatment and for at least six months after the last dose of gilteritinib; male patients should utilize contraception during treatment and for at least 4 months after the last dose of gilteritinib

#### **Co-Pay Assistance**

- Patients with commercial paying insurance are eligible for co-pay support
  - Patients pay as little as \$0 per prescription
  - Enrollment is for a 12 month period and the program benefit covers up to a maximum of \$25,000 per calendar year
  - Contact XOSPATA support solutions (1-844-632-9272) OR your preferred network specialty pharmacy to determine eligibility and enrollment
