**RESULTS**

No population health impact of our practice transformation has yet been published. This is consistent with our focus on a more patient-centered approach in the delivery of care. However, based on our experience, we believe that patient-centered care has the potential to improve population health outcomes. We have observed improvements in patient satisfaction, such as a reduction in ER visits and hospitalizations, which are key indicators of population health. These improvements are consistent with the findings of other studies that have shown that patient-centered care can lead to lower healthcare costs and improved patient outcomes.

**FUTURE STEPS**

At Carolina Blood and Cancer Care, our mission is to provide the highest quality of care to our patients. We have implemented patient-centered care practices, which are designed to improve patient outcomes and reduce healthcare costs. Our approach is based on the principles of patient-centered care, which emphasize the importance of patient involvement in the decision-making process and the provision of care that is tailored to the needs of the individual patient. We have observed that these practices can lead to improved patient outcomes and reduced healthcare costs. We are committed to continuing to improve our patient-centered care practices and to sharing our experiences with other healthcare providers. We believe that by working together, we can improve the health of our communities and reduce healthcare costs.
