

### Background

- NCODA has partnered with Medically Integrated Pharmacies (MIP) across the country to deliver patient support resources for those patients prescribed Selinexor
- These resources include Treatment Support Kits (TSK), Oral Chemotherapy Education (OCE) sheets and Positive Quality Interventions (PQI)
- TSK Contents: Selinexor treatment booklet, treatment journal, calendar, digital thermometer, water bottle, loperamide hydrochloride caplets.
- Patients who were started on Selinexor for any approved indication were given a treatment support kit with their first fill.
- Practices were then able to follow patients to track duration of therapy

### Objectives

- To study the correlation between interventions in Medically Integrated Pharmacy practices and duration of therapy on Selinexor
- To understand the implementation of positive quality interventions and treatment support kits with oncology healthcare professionals
- To engage NCODA's community of healthcare professionals to better serve their oncology patients both clinically and operationally

### Results

- 8 patients were excluded based on per-protocol therapy and coming off therapy for external factors
- 77/107 patients were on a non-triplet therapy regimen with an average duration of therapy of 16.39 weeks
- Based on safety data from STORM trial, the median duration of therapy for Selinexor and dexamethasone is 8 weeks

Therapy	Triplet	Non-triplet	Excluded	Included
Weeks on therapy	17.97	16.39	17.82	16.83
# Patients	30	77	99	107

### Methods

- This initiative collected data from 18 practice sites that operate as MIPs and provided education through PQIs
- The collected data included 107 patients who were on Selinexor mono-, dual-, and triple therapy and utilized TSK kits from the initiation of their therapy
- Duration of data collection: April 2021 to August 2022
- Outcomes: duration of therapy of these patients' vs those without TSK

### Benefits to practices

- Demonstrating high-level care performed by the respective medically integrated care teams
- Low-burden workflow to implement research plan into practice
- No unnecessary exchange of personal health information
- Helping promote standardized and effective oncology care nationwide

### Conclusion

- Medically Integrated Pharmacies equipped with NCODA resources drastically increases patients' duration of therapy
- Future studies will retrospectively identify patients from this trial and new start patients on a triplet therapy
