## INTRODUCTION

- Myelofibrosis (MF) is a life-limiting malignancy characterized by marrow fibrosis, splenomegaly, and progressive cytopenias.
- Pacritinib (PAC) is a JAK1-sparing inhibitor of JAK2/IRAK1/ACVR1<sup>1,2</sup> that demonstrated spleen volume response (SVR) benefit vs best available therapy (BAT; including ruxolitinib [RUX]) in MF patients with platelets  $\leq 100 \times 10^9/L$  in the PERSIST-2 study.<sup>3</sup>
- JAK2 inhibitors can reduce spleen volume, which is considered a surrogate for disease response.
- The relationship between SVR and overall survival (OS) in MF patients with thrombocytopenia is unknown.

## AIM

- To assess whether SVR on PAC or on BAT (including RUX) is associated with prolonged survival in MF patients with thrombocytopenia.

## METHODS

- This analysis includes PERSIST-2 patients who were alive and on study at the start of the week 12 SVR window (study week 10) on PAC 200 mg twice daily (BID) and on BAT.
- Week 12 SVR was evaluated using various volume reduction thresholds:  $\geq 35\%$ ,  $\geq 20\%$ ,  $\geq 10\%$ , and  $>0\%$ .
- OS was evaluated among SVR responders vs. non-responders at each threshold based on landmark analysis methodology. Survival was compared using the log-rank test. The impact of baseline imbalances between groups was assessed using Cox modeling.

## RESULTS

- Among all tested SVR response thresholds, SVR  $\geq 10\%$  demonstrated the greatest separation in OS curves between responders vs. non-responders on PAC, but not on BAT (Figure 1).
- Compared to SVR  $\geq 10\%$  responders, non-responders had smaller spleen volumes and were more likely to require red blood cell (RBC) transfusions at baseline, shown in Table 1.

**Table 1. Characteristics of SVR  $\geq 10\%$  Responders and Non-Responders**

| Baseline characteristics              | PAC 200 mg BID |             | BAT       |             |
|---------------------------------------|----------------|-------------|-----------|-------------|
|                                       | R<br>N=65      | N-R<br>N=24 | R<br>N=28 | N-R<br>N=56 |
| Age, median                           | 66             | 67          | 66        | 69          |
| DIPSS high risk                       | 18.5%          | 46%         | 21%       | 25%         |
| PLT count ( $\times 10^9/L$ ), median | 58             | 67          | 68        | 47          |
| Hemoglobin (g/dL), median             | 9.7            | 9.3         | 10.0      | 9.6         |
| Requires RBC transfusion              | 38%            | 58%         | 32%       | 54%         |
| Prior JAK2 inhibitor                  | 45%            | 50%         | 64%       | 45%         |
| Spleen volume ( $cm^3$ ), median      | 2573           | 2094.5      | 2907      | 2393        |
| Palpable spleen length (cm), median   | 15.00          | 12.75       | 12.00     | 14.50       |

BAT, best available therapy; BID, twice daily; N-R, non-responder; PAC, pacritinib; PLT, platelet; R, responder; RBC, red blood cell.

## RESULTS

### SVR is associated with survival benefit on PAC, but not on BAT

- On the PAC arm, SVR  $\geq 10\%$  was prognostic for survival (Figure 1C). More stringent SVR thresholds ( $\geq 20\%$ ,  $\geq 35\%$ ) were also prognostic, but led to less separation between responder and non-responder survival curves (Figure 1A, B).
  - Adjusting for baseline spleen volume and requirement for RBC transfusion (in a univariate analysis) did not impact the survival benefit seen with SVR  $\geq 10\%$  on the PAC arm.
- Achieving any degree of spleen volume reduction (SVR  $>0\%$ ) was also associated with improved survival on PAC (hazard ratio [HR]=0.08 [95% confidence interval [CI]: 0.01, 0.51],  $P=0.0007$ ), though the separation between responder and non-responder survival curves was not as great as at the SVR  $\geq 10\%$  threshold.
- SVR did not predict survival on BAT, regardless of SVR threshold. (Figure 1)
  - 11% (3/28) of patients on BAT who achieved SVR  $\geq 10\%$  died compared to a similar percent (14%, 8/56) of non-responders.

**Figure 1. Overall Survival Stratified by SVR, Data shown on PAC (left) and BAT (right)**

### Pacritinib

#### (A) OS stratified by $\geq 35\%$ SVR

|               |           |    |    |    |   |   |   |   |
|---------------|-----------|----|----|----|---|---|---|---|
| N             | Responder | 14 | 9  | 6  | 2 | 1 | 0 | 0 |
| Non-Responder | 75        | 53 | 35 | 21 | 8 | 1 | 0 | 0 |

#### (B) OS stratified by $\geq 20\%$ SVR

|               |           |    |    |    |    |   |   |   |
|---------------|-----------|----|----|----|----|---|---|---|
| N             | Responder | 43 | 34 | 25 | 12 | 4 | 1 | 0 |
| Non-Responder | 46        | 28 | 16 | 11 | 5  | 0 | 0 | 0 |

#### (C) OS stratified by $\geq 10\%$ SVR

|               |           |    |    |    |    |   |   |   |
|---------------|-----------|----|----|----|----|---|---|---|
| N             | Responder | 65 | 51 | 33 | 17 | 6 | 1 | 0 |
| Non-Responder | 24        | 11 | 8  | 6  | 3  | 0 | 0 | 0 |

### Best Available Therapy (including RUX)

|               |           |    |    |    |   |   |   |   |
|---------------|-----------|----|----|----|---|---|---|---|
| N             | Responder | 7  | 5  | 4  | 1 | 0 | 0 | 0 |
| Non-Responder | 77        | 55 | 37 | 17 | 4 | 2 | 0 | 0 |

|               |           |    |    |    |   |   |   |   |
|---------------|-----------|----|----|----|---|---|---|---|
| N             | Responder | 15 | 10 | 7  | 3 | 0 | 0 | 0 |
| Non-Responder | 69        | 50 | 34 | 15 | 4 | 2 | 0 | 0 |

|               |           |    |    |    |   |   |   |   |
|---------------|-----------|----|----|----|---|---|---|---|
| N             | Responder | 28 | 23 | 16 | 7 | 1 | 0 | 0 |
| Non-Responder | 56        | 37 | 25 | 11 | 3 | 2 | 0 | 0 |

### Low-dose ruxolitinib led to SVR $\geq 10\%$ on BAT, but not survival benefit

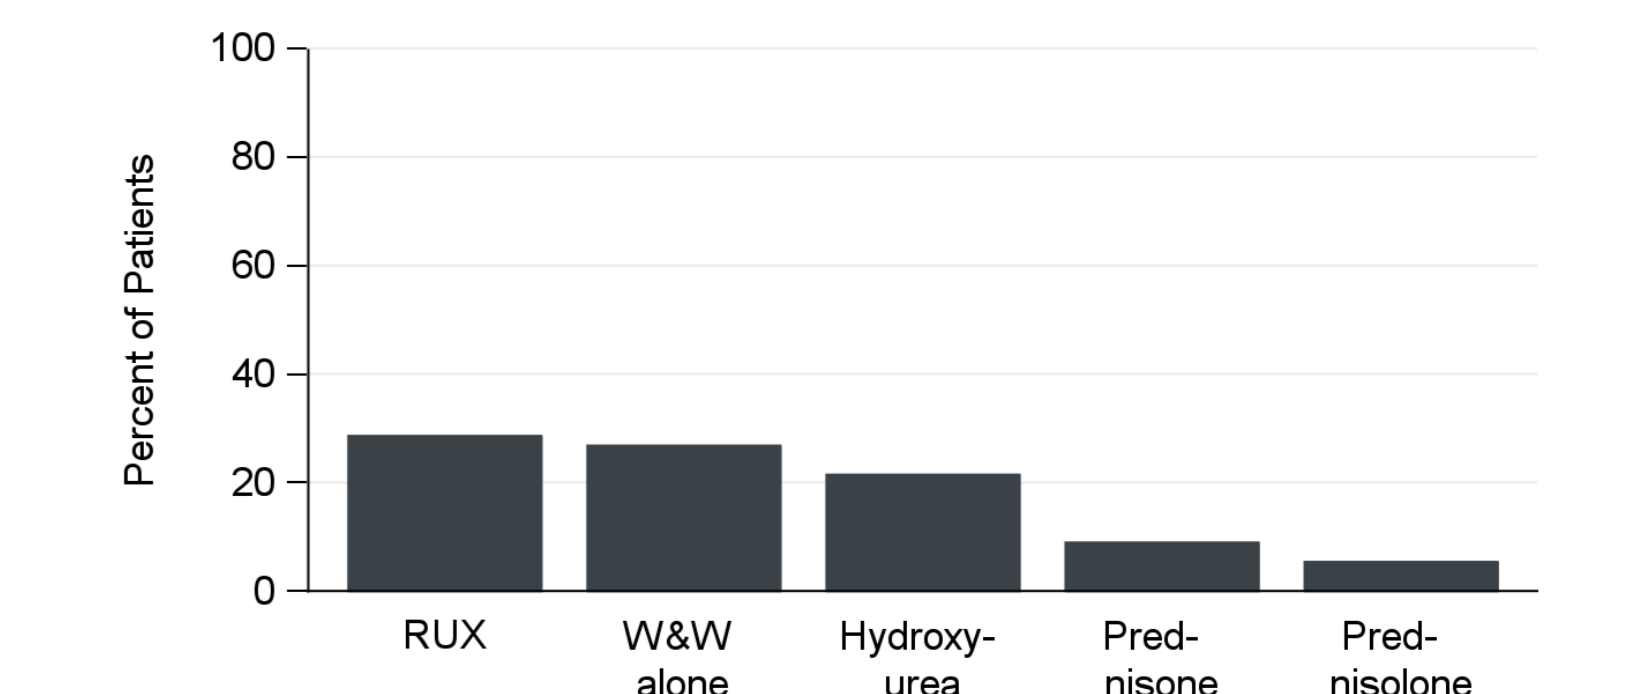

- On the PAC arm, median dose intensity through week 12 was 100% (200 mg BID) among SVR  $\geq 10\%$  responders and non-responders.
- Of the 28 patients on BAT who achieved SVR  $\geq 10\%$ , 23 (82%) were treated with RUX prior to the week 12 SVR assessment. Of these 23 patients on RUX:
  - 78% were on RUX  $\leq 10$  mg BID at the time of the landmark analysis
  - 43% on RUX  $\leq 5$  mg BID at the time of the landmark analysis
- Breakdown of BAT treatments stratified by SVR  $\geq 10\%$  response are shown in Figure 2.

**Figure 2. BAT Treatments in SVR  $\geq 10\%$  Responders and Non-Responders**

#### (A) BAT Components, SVR $\geq 10\%$ Responders

#### (B) BAT Components, SVR $\geq 10\%$ Non-Responders

Agents used in  $\geq 5\%$  of patients shown. As patients may have been on multiple agents, percentages do not sum to 100%.

### Spleen length reduction (by palpation) is not as prognostic as SVR (by imaging) on PAC

- Achieving  $\geq 20\%$  reduction in palpable spleen length on PAC is associated with OS benefit (HR=0.14 [95% CI: 0.02-1.26], Figure 3), but separation of curves is not as great as prognostication based on SVR.

**Figure 3. Overall Survival Stratified by Spleen Length Reduction (by Palpation), PAC arm**

#### (A) OS by $\geq 50\%$ length reduction

|    |    |    |    |    |   |   |   |   |
|----|----|----|----|----|---|---|---|---|
| N  | R  | 15 | 10 | 8  | 3 | 2 | 0 | 0 |
| NR | 74 | 52 | 33 | 20 | 7 | 1 | 0 | 0 |

#### (B) OS by $\geq 35\%$ length reduction

|    |    |    |    |    |   |   |   |   |
|----|----|----|----|----|---|---|---|---|
| N  | R  | 30 | 22 | 16 | 7 | 2 | 0 | 0 |
| NR | 59 | 40 | 25 | 16 | 7 | 1 | 0 | 0 |

#### (C) OS by $\geq 20\%$ length reduction

|    |    |    |    |    |    |   |   |   |
|----|----|----|----|----|----|---|---|---|
| N  | R  | 54 | 41 | 28 | 13 | 5 | 0 | 0 |
| NR | 35 | 21 | 13 | 10 | 4  | 1 | 0 | 0 |

## CONCLUSIONS

- In MF patients with thrombocytopenia (platelets  $\leq 100 \times 10^9/L$ ), achieving SVR  $\geq 10\%$  at week 12 on full-dose PAC was associated with significant OS benefit.
- By contrast, this association was not found with BAT, including patients on RUX (most at doses of 10 mg BID or less).
- As PAC can be given at full dose regardless of platelet count, it is possible that PAC may offer a unique survival advantage for MF patients with moderate or severe thrombocytopenia who achieve  $\geq 10\%$  spleen reduction.
