

Positive Quality Intervention: Copanlisib (Aliqopa®) for the Management of Relapsed/Refractory Follicular Lymphoma

Description: There are a number of treatment options for patients with follicular lymphoma that have relapsed or are refractory to first line options. The purpose of this PQI is to discuss appropriate patient identification and clinical considerations around the use of copanlisib for the treatment of adults who have received at least two other previous therapies.

Background: Non-Hodgkin's lymphoma includes both aggressive and indolent malignancies. Follicular lymphoma is the most common subtype of indolent Non-Hodgkin's Lymphoma. Copanlisib is an intravenous phosphatidylinositol 3-kinase (PI3K) inhibitor. PI3K pathways are often hyperactive in B-Cell malignancies. A phase II study in follicular lymphoma demonstrated an overall response rate of 59% with copanlisib. In 168 adults with exposure to copanlisib, the most common treatment related adverse events in any grade were hyperglycemia (54%), leukopenia (36%), fatigue (36%), diarrhea (36%), and hypertension (35%). Grade 3+ adverse events were observed for hyperglycemia (39%), leukopenia (27%), hypertension (27%) and infections (14%).

PQI Process: Upon receipt of an order for copanlisib:

- Ensure patient is an appropriate candidate for copanlisib and has received at least two prior therapies
- Discuss potential risks of copanlisib therapy:
 - Increased risk of infection
 - Monitor for signs and symptoms of infection, including pneumocystis jirovecii pneumonia (PJP)
 - For suspected PJP infection of any grade: hold copanlisib; if infection is confirmed, treat until resolution, then resume copanlisib at previous dose with concomitant PJP prophylaxis
 - Hyperglycemia
 - Monitor blood glucose at least pre- and post-dose; it may be necessary to monitor more frequently as clinically indicated
 - In clinical trials, copanlisib induced hyperglycemia peaked 5-8 hours post-infusion and remained elevated 24 hours post-infusion
 - Pre-dose fasting blood glucose ≥ 160 mg/dL or random (non-fasting) blood glucose ≥ 200 mg/dL:
 - Hold copanlisib until fasting glucose is ≤ 160 mg/dL or a random (non-fasting) blood glucose is ≤ 200 mg/dL
 - Pre-dose or post-dose blood glucose ≥ 500 mg/dL:
 - First occurrence: Hold copanlisib until fasting blood glucose is ≤ 160 mg/dL, or a random (non-fasting) blood glucose is ≤ 200 mg/dL; reduce dose from 60 mg to 45 mg
 - Subsequent occurrences: Withhold copanlisib until fasting blood glucose is ≤ 160 mg/dL, or a random (non-fasting) blood glucose is ≤ 200 mg/dL. Reduce dose from 45 mg to 30 mg. If hyperglycemia is persistent at the 30 mg dose, discontinue copanlisib

Important Notice: NCODA has developed this Positive Quality Intervention platform. This platform represents a brief summary of medication uses and therapy options derived from information provided by the drug manufacturer and other resources. This platform is intended as an educational aid and does not provide individual medical advice and does not substitute for the advice of a qualified healthcare professional. This platform does not cover all existing information related to the possible uses, directions, doses, precautions, warning, interactions, adverse effects, or risks associated with the medication discussed in the platform and is not intended as a substitute for the advice of a qualified healthcare professional. The materials contained in this platform are for informational purposes only and do not constitute or imply endorsement, recommendation, or favoring of this medication by NCODA, which assumes no liability for and does not ensure the accuracy of the information presented. NCODA does not make any representations with respect to the medications whatsoever, and any and all decisions, with respect to such medications, are at the sole risk of the individual consuming the medication. All decisions related to taking this medication should be made with the guidance and under the direction of a qualified healthcare professional. *Updated 2.23.22*

- Hypertension:
 - Monitor blood pressure at least pre- and post-dose; it may be necessary to monitor more frequently as clinically indicated
 - In clinical trials, blood pressure remained elevated 6-8 hours post infusion
 - Hold, reduce dose, or discontinue based on the severity and persistence of hypertension
- Drug-Drug Interactions
 - Avoid concomitant use of strong CYP3A4 inhibitors
 - If concurrent therapy cannot be avoided, reduce the copanlisib dose to 45 mg
- Reconstitution:
 - Add 4.4 mL of sterile NS and gently shake for 30 seconds, then let stand for 1 minute
 - If particulates remain, gently shake again and let sit for 1 minute
 - Final concentration 15 mg/mL
- Storage:
 - Reconstituted or diluted solution: 2-8 degrees C up to 24 hours
 - Avoid exposure to direct sunlight
- Administration: Infuse over 1 hour

Patient Centered Activities:

- Educate patients on copanlisib therapy and recommend appropriate interventions:
 - Hyperglycemia: Monitor patients for signs of confusion, feeling sleepy, increased thirst, increased hunger, passing urine more often, flushing, fast breathing, or breath that smells like fruit
 - Hypertension: Monitor patients for signs/symptoms of high blood pressure like very bad headache or dizziness, passing out, or change in eyesight
 - Diarrhea
 - Monitor bowel movements occurring each day
 - Recommend to patients to drink 8–10 glasses of water each day
 - Antidiarrheal medications may be used to help control symptoms
 - See [Oncolytic Induced Diarrhea](#) PQI and provide [Oral Chemotherapy Education Supplemental Sheet](#)
 - Allergic or cutaneous reactions: Monitor for signs of rash, hives, itching, red/swollen/blistered/peeling skin with/without fever, wheezing, tightness in the chest/throat, trouble breathing/swallowing/talking, unusual hoarseness, or swelling of the mouth/face/lips/tongue/throat
 - Infections and pneumonitis: Monitor for any signs of lung or breathing problems like shortness of breath, fever, chills, very bad sore throat, ear or sinus pain, cough, increased sputum or change in color of sputum, pain with passing urine, mouth sores, or wound that will not heal
- Patient Assistance: [NCODA Financial Assistance Tool](#)
