

Positive Quality Intervention: Neratinib (Nerlynx®) Diarrhea Management

Description: Diarrhea is the main toxicity of neratinib treatment occurring in 95% of patients in the ExteNET trial on the neratinib arm in which antidiarrheal prophylaxis was not protocol specified.¹ Various prevention and treatment strategies for diarrhea have been studied and will be discussed in this document.

Background: Neratinib is indicated for the extended adjuvant treatment of adult patients with early stage HER2-overexpressed/amplified breast cancer, following adjuvant trastuzumab based therapy. Neratinib is also indicated in combination with capecitabine in metastatic/advanced HER2-positive breast cancer following 2 or more anti-HER2 based regimens. The majority (95%) of patients experienced diarrhea in the first month of treatment in ExteNET. Median time to onset of any grade diarrhea is 2 days (8 days for Grade 3) and median cumulative duration of diarrhea was 59 days (5 days for Grade 3). The phase 2 CONTROL trial was designed to investigate various approaches to preventing and managing diarrhea in patients on neratinib, including various anti-diarrheal combinations, as well as dose escalation. The neratinib full prescribing information was updated in June 2021 to include dose escalation.

PQI Process: Upon receipt of neratinib prescription:

- Consider dose escalation (see *Supplemental Information*)
- Diarrhea Prophylaxis:
 - Begin prophylaxis with the first dose of neratinib and continue for 2 cycles depending on the regimen selected and the patient response
 - Ensure patient has instructions and supply of antidiarrheals (see *Supplemental Information*)
 - Refer to [Oncolytic Induced Diarrhea PQI](#)
 - Identify drug-drug interactions and side effect profiles of loperamide, colestipol, and budesonide when making clinical recommendations
 - Consider weekly assessment of diarrhea throughout the first 2 cycles
- Drug-Drug Interactions:
 - Avoid concomitant use of PPIs
 - If H2-antagonists must be used, administer neratinib 2 hours before or 10 hours after
 - Other antacids (Tums, Maalox) should be separated by at least 3 hours
- Verify in EMR that patient is scheduled for CMP for the first 3 months then every 3 months as clinically indicated

Patient Centered Activities:

- Provide [Oral Chemotherapy Education \(OCE\) Sheet](#) and [Oral Chemotherapy Education Supplemental Sheet](#)
- Express importance of diarrhea prophylaxis and enable patients to obtain anti-diarrheal
- Consider providing [Neratinib \(Nerlynx®\) Treatment Support Kit \(TSK\)](#)
- Neratinib should be taken with food and around the same time each day
 - Dose escalation – Take three tablets (120 mg) daily for 7 days, then four tablets (160 mg) daily for 7 days, then six tablets (240 mg) daily thereafter
 - Initiation without escalation – Take six tablets (240 mg daily) with loperamide during the first 56 days, then loperamide as needed to maintain daily bowel movements
- Maintain adequate oral hydration throughout treatment unless otherwise indicated
- Counsel on other possible side effects (from ExteNET trial)

Supplemental Information:

Dosing Regimens from CONTROL study:

Loperamide	4 mg TID days 1-14, then 4 mg BID days 15-56
Budesonide	9 mg/day for 1 cycle + loperamide 4 mg TID days 1-14, then 4 mg BID days 15-56
Colestipol	2 gm BID for 1 cycle + loperamide PRN + loperamide 4 mg TID days 1-14, then 4 mg BID days 15-28
Neratinib	120 mg/day on days 1–7, then 160 mg/day on days 8–14, then 240 mg/day through day 364 or 160 mg/day on days 1–14, then 200 mg/day on days 15–28, then 240 mg/day through day 364

Dose Escalation Regimen:

- 120 mg (3 tablets) daily days 1-7
- 160 mg (4 tablets) daily days 8-14
- 240 mg (6 tablets) daily thereafter

Dosage Adjustment for Diarrhea:

Grade 1 or 2 (≤ 5 days) or Grade 3 (≤ 2 days)

- Maximize use of antidiarrheal agents and assess diet and aggravating substances
- When diarrhea has improved to \leq Grade 1 or baseline, initiate loperamide 4 mg with each subsequent neratinib dose

Grade 2 (> 5 days) or Grade 3 (> 2 days) or any grade with complicating features of dehydration, fever, hypotension, renal failure, or Grade 3/4 neutropenia):

- Interrupt treatment. Modify diet; maintain fluid intake of ~ 2 L
- If diarrhea improves to \leq Grade 1 in 1 week or less, resume neratinib at the same dose
- If diarrhea improves to \leq Grade 1 in more than 1 week, resume neratinib at the next lower dose
- If diarrhea has improved to \leq Grade 1/baseline, initiate loperamide 4 mg with each subsequent dose

Recurrent Grade 2 or more occurring at 120 mg once daily dose, or, Grade 4 diarrhea:

- Permanently discontinue neratinib
